Engineer / CAD Technician Drawing Design Component/ Features / Principles CAD Geometric Design The geometric shape of an object is described in three dimensions (3D). One form of this is a solid, which is a three-dimensional volume that encloses other objects. A solid may have a hole in the middle, which is known as a void. The placement of the object is not defined in Cartesian coordinates, but by the coordinate system. Coordinate System Coordinate systems are based on points. Each point is named by its coordinate values. A point (x,y,z) is defined by its position along the three axes of a Cartesian coordinate system. On an ordinary two-dimensional (2D) sheet of

paper the position of a point is shown in two coordinates (x,y). On a three-dimensional drawing there are three coordinates (x,y,z). Each axis is defined by a value. X-axis: x, range from -10 to 10, perpendicular to the drawing plane Positions from -1 to 10 are used. 0 is at the origin. Y-axis: y, range from -10 to 10, perpendicular to the drawing plane Positions from -1 to 10 are used. 0 is at the origin. Z-axis: z, range from -10 to 10 Positions from -1 to 10 are used. 0 is at the origin. A point is located on the x-y-axis or the x-y-z axis. A point is located on the x-axis, y-axis or z-axis.
